More modularity

EHB1: EtherCAT® hub for CIBANO 500

CIBANO 500 combines a micro-ohm-meter, timing analyzer, and a coil and motor supply in a single device. This enables all important circuit breaker tests to be carried out even when a station battery is not available.

The new CIBANO 500 accessory EHB1 specifically facilitates tests of high-voltage

circuit breakers with many interrupter units. With the EHB1, you can test all the important circuit breaker parameters without rewiring, including circuit breaker designs with more than eight interrupter units. This enables you to carry out your tests more comfortably and safely.
